Like many other software programs, Photoshop has a learning curve. If you're new to Photoshop, you may be overwhelmed and confused by the many different options available to alter images. Take some time with a beginner's course, and you'll find Photoshop's complexity will go down quickly. Browsing through an image Photoshop enables you to work on images in four ways: Viewing (Windows): You can view an image and zoom in or out to get a close-up look at details. In this way, you have no control over what you see. Edit: You can make changes to your image through the use of tools on the menus, for example, by adding a new layer, adding adjustment layers, or replacing a layer with one of your own. You can then apply the changes by using the layers panel to replace the original image with the new. Zoom: In this way, you zoom into a small portion of an image so you can zoom in and out on a specific part of a photograph. You also can change the level of magnification to see just the amount of detail you require. With most image software programs, you can change the size of an image to make it bigger or smaller, but you cannot zoom in and out of an image. When viewing an image, you have access to all the controls in the software, like a traditional desktop, as shown in Figure 3-1. The controls are displayed on the right side of the image window. **Figure 3-1:** You can see the controls displayed above the image window in which you're viewing it. When you are viewing an image, press the Tab key to move through the tabs at the top of the window until you reach the bottom. You then press Enter to move forward. Clicking and dragging is a method for enlarging or shrinking an image by using the selection tool that you find at the bottom of the window or the selection tool near the top. It is a good way to crop an image, which means to trim away empty or unwanted areas of an image. Click and drag to select the area you want to crop out or add to the image. When you're done, you can press Enter (Return on the Mac) or press Esc. The image will be cropped to fit the

selection area. Releasing the Ctrl (Option on the Mac) key opens the select menu. You can then select different options to crop, resize,

). To reflect the fact that many unlinked loci are autochthonous with recent ancestry and hence expected to segregate, we use the F1 mutation rate in our model. The backwards in time coalescent model is implemented in the

software package IMA. The model assumes a continuous distribution of haplotypes and requires an estimate of the time of coalescence from a continuous-time population model. Two continuous-time models of demographic history are used in IMA, a Dirichlet distribution (DR) and a Gamma distribution (GAM) [pgen.1004523-Hey2]. The program assumes that each locus is neutral and that mutation rate, recombination rate and population size are independent of the locus, which may be justified given the locus-specific conservation, conserved linkage, and predicted functional importance. We allow each locus to have its own mutation rate, recombination rate and population size. The 95% highest posterior density (HPD) of the mutation rate estimates by [pgen.1004523-Myers1] was rescaled to 1 per generation using the equation $\omega_{\sim a} = (2N_{\sim e})^{-1}$, where $\omega_{\sim a}$ is the mutation rate per generation and $N_{\sim e}$ is the effective population size. We used a custom C++ library that called the R statistical computing language [pgen.1004523-R1] to perform several different statistical tests on the data. To compare the power of the multiple sequence alignment (MSA), maximum parsimony (MP) and Bayesian analyses, we computed the area under the receiver operating characteristic curve (AUC) using a custom program with the program ROCR (see [Text S2](#pgen.1004523.s023){ref-type="supplementary-material"}). The AUC is the probability that a randomly chosen genotype from the set of true genotypes is classified as being genotyped as higher than a randomly chosen genotype among the observed genotypes.
